Perle Hiring Team
perle.ai

Dear Perle Hiring Team,

I am writing to apply for the **Native Bahasa Indonesia Speaker** position for linguistic data evaluation and annotation on your AI/NLP project. I am a native speaker of Bahasa Indonesia currently residing in Jakarta, hold a Master's degree (M.Kom, ITS Surabaya), and have spent seven years building and evaluating AI/NLP systems for Indonesian government and diplomatic institutions. I believe I offer something rare for this role: deep technical understanding of how LLMs process language, combined with rigorous native-speaker judgment.

The most directly relevant work I have done is leading the **AI Chatbot KJRI Dubai**, one of Indonesia's first LLM-agent deployments in diplomatic infrastructure. In that project, I was responsible not only for building the system (Google ADK, FastAPI, LangChain, PostgreSQL) but for continuously evaluating Bahasa Indonesia outputs: assessing grammatical correctness, semantic accuracy, formal register appropriate to a government consular context, and cultural appropriateness for Indonesian citizens abroad. I iteratively identified and categorized linguistic issues in chatbot responses, distinguishing hallucinations from phrasing errors from register mismatches, and fed that structured analysis back into prompt and model refinements. That evaluation loop is precisely the work Perle describes.

Beyond the chatbot, I have authored and reviewed large volumes of formal Indonesian-language content across eight production systems: user-facing consular service text, onboarding flows, notification messages, and 10+ government procurement specifications (KAK/TOR) reviewed by senior Ministry of Foreign Affairs officials for linguistic precision. Earlier, as a Software Engineer at **KBRI Malaysia** (2019–2021), all consular applications I built were in Bahasa Indonesia, requiring careful attention to register, clarity, and compliance with official government communication standards.

My **ISO 27001 Lead Auditor** credential (2019) underpins the QA discipline your role requires: systematic issue identification, structured categorization, clear evidence-backed reporting, and rigorous adherence to defined guidelines. These habits transfer directly to linguistic data annotation: identifying error types, maintaining consistent classification, and producing feedback that is actionable for model improvement teams.

Perle's mission to deliver expert-in-the-loop data that makes AI safe, accurate, and defensible is exactly the kind of work I want to contribute to. I understand the stakes of linguistic data quality at the model level, not just the surface level, and I bring both the native fluency and the analytical rigor to deliver evaluations that are genuinely useful to model builders.

I would welcome the opportunity to discuss how my background fits your project's needs. Thank you for your time and consideration.

Sincerely,

Ahmad Syafiq Kamil
